# RS CDS activities

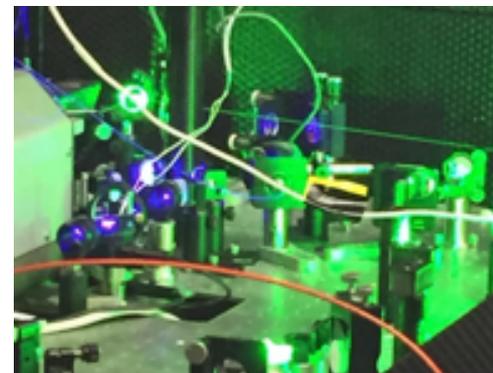

J. McCorkel, K. Thome, B. McAndrew, A. Angal

# CLARREO RS GSFC Overview

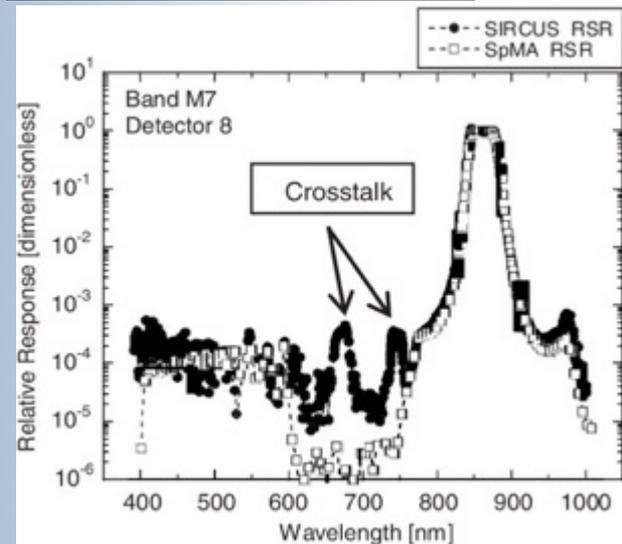

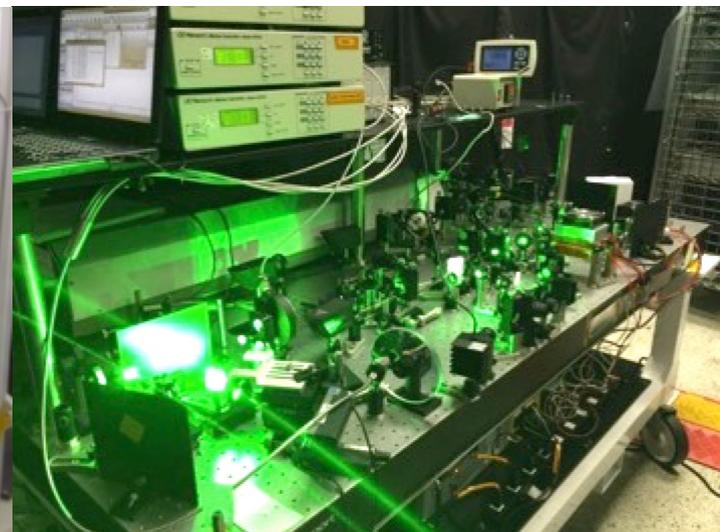

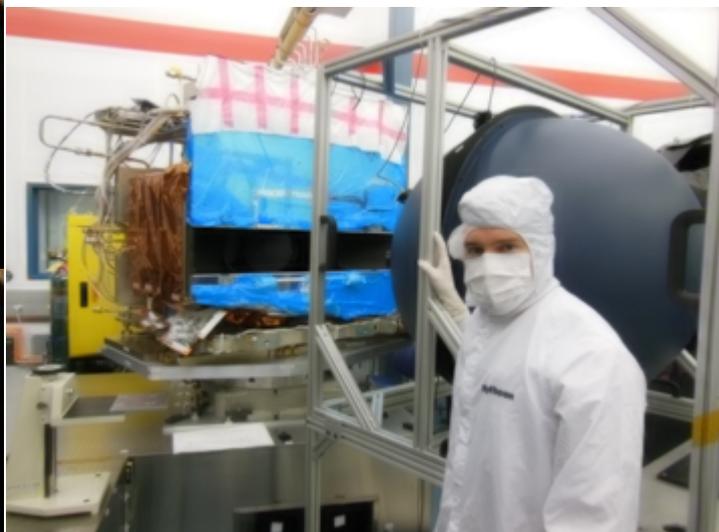

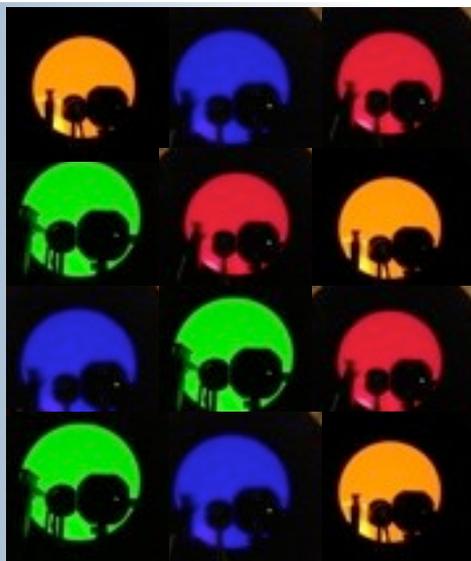

- Past seven months since last meeting has seen work on GLAMR calibration facility, Calibration Demonstration System (CDS) as well as Pathfinder activities
- Coordinating and collaborated with other projects to optimize resources
  - Collaboration with JPSS, team also leading laser-based characterization of J2 VIIRS
  - NIST involvement
- Improvements to laboratory calibration system
  - Automation and robustness
  - Demonstration of SWIR source and radiometers

# GLAMR

Goddard Laser for Absolute Measurement of Radiance

## GLAMR is required for improving instrument model parameterization

- Spectral/radiometric response
- Linearity
- Crosstalk
- Detector-to-detector differences
- Stray/scattered light

# GLAMR Traceability Path

*NIST Facility*

**POWR**  
Primary Optical Watt  
Radiometer

Stabilized laser source is used to transfer radiometric scale from POWR to portable transfer radiometer via another standard radiometer

**LTD-11 #107**  
transfer radiometer

*Sensor vendor facility*

**LTD-11 #107**  
transfer radiometer

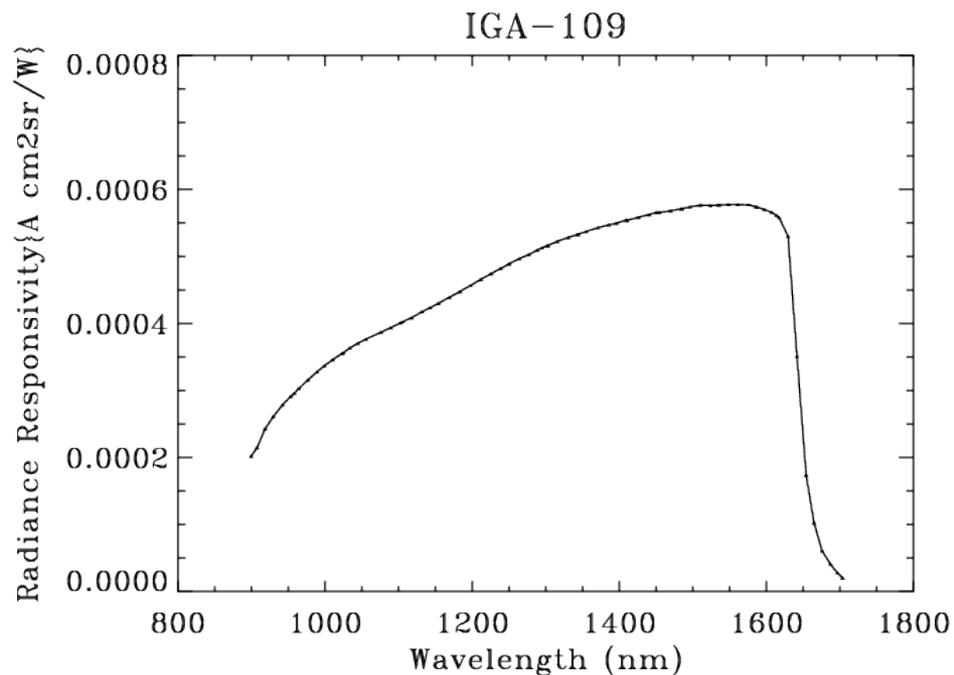

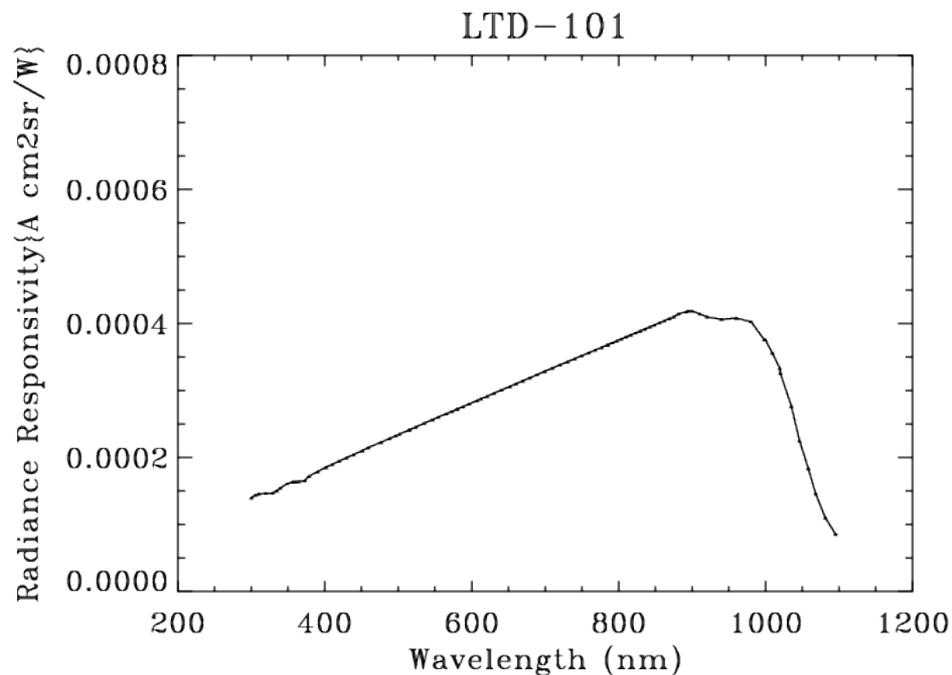

**Sphere Monitor**

**Satellite/airborne sensor**

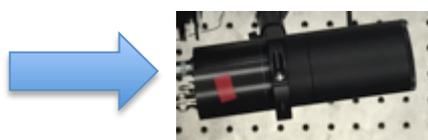

# Traceability From NASA's NIST-Calibrated Transfer Radiometers

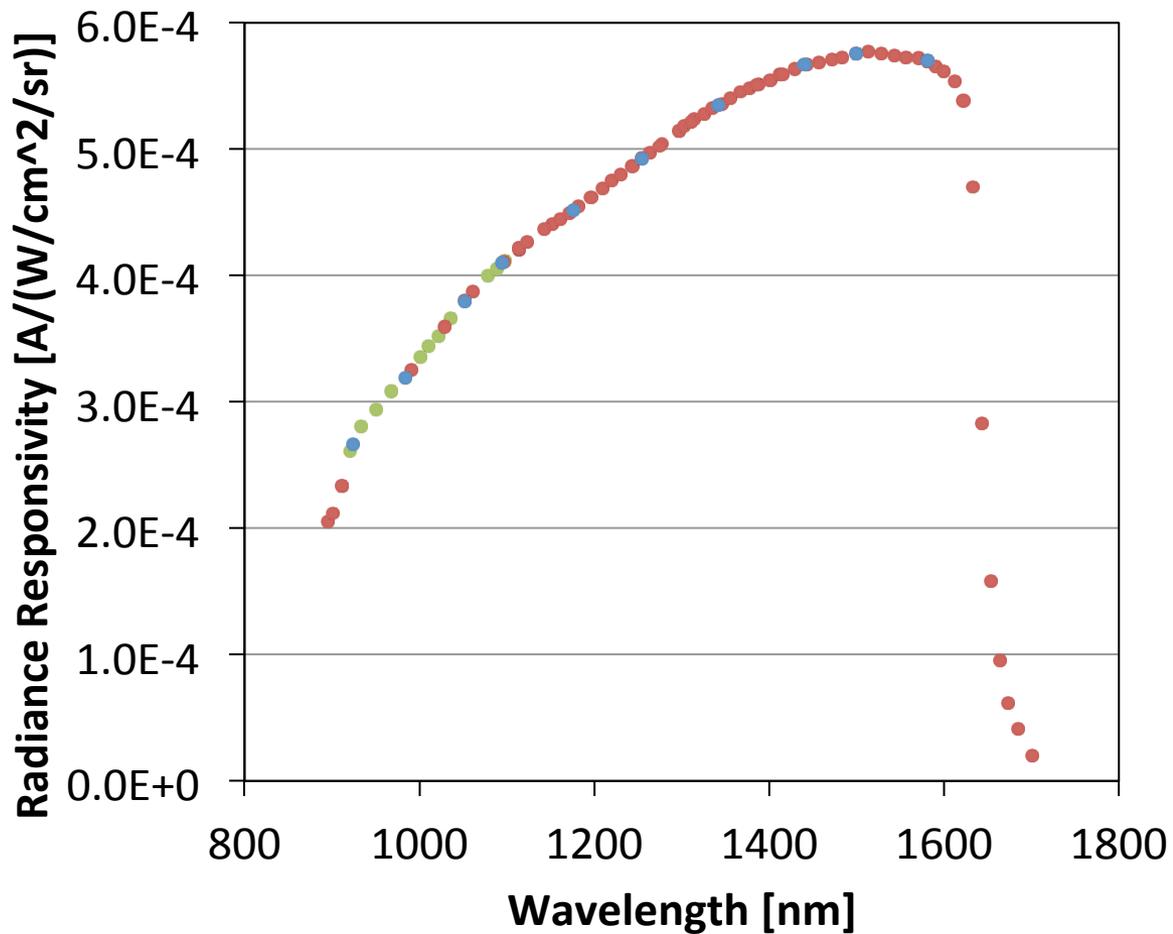

\*NIST is currently finalizing calibration of Si, IGA, and Extended IGA transfer radiometers that will be used for J-2 VIIRS

# NIST radiometric characterization of NASA transfer radiometer

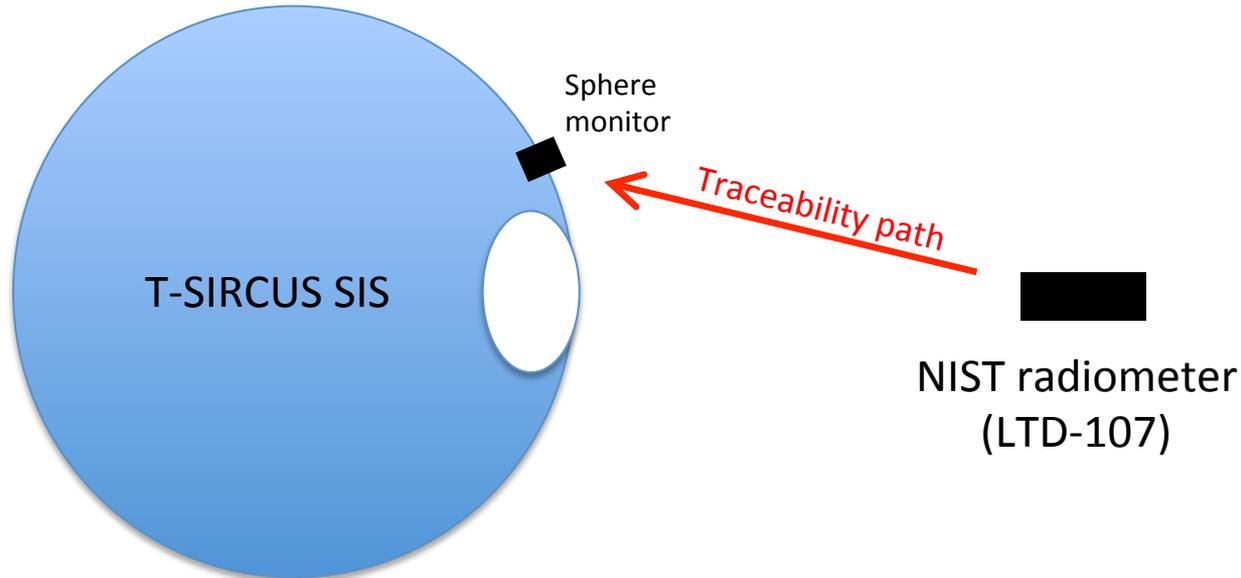

**L-1 DET-8 SN 107  
Radiance Responsivity**

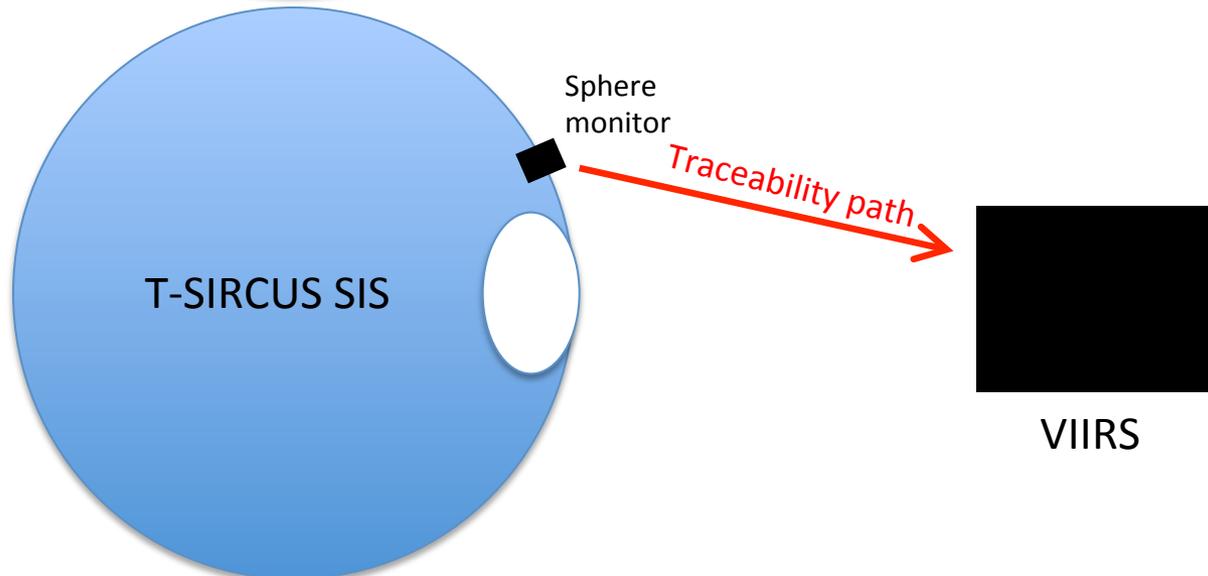

# Measurements For Radiometric Traceability

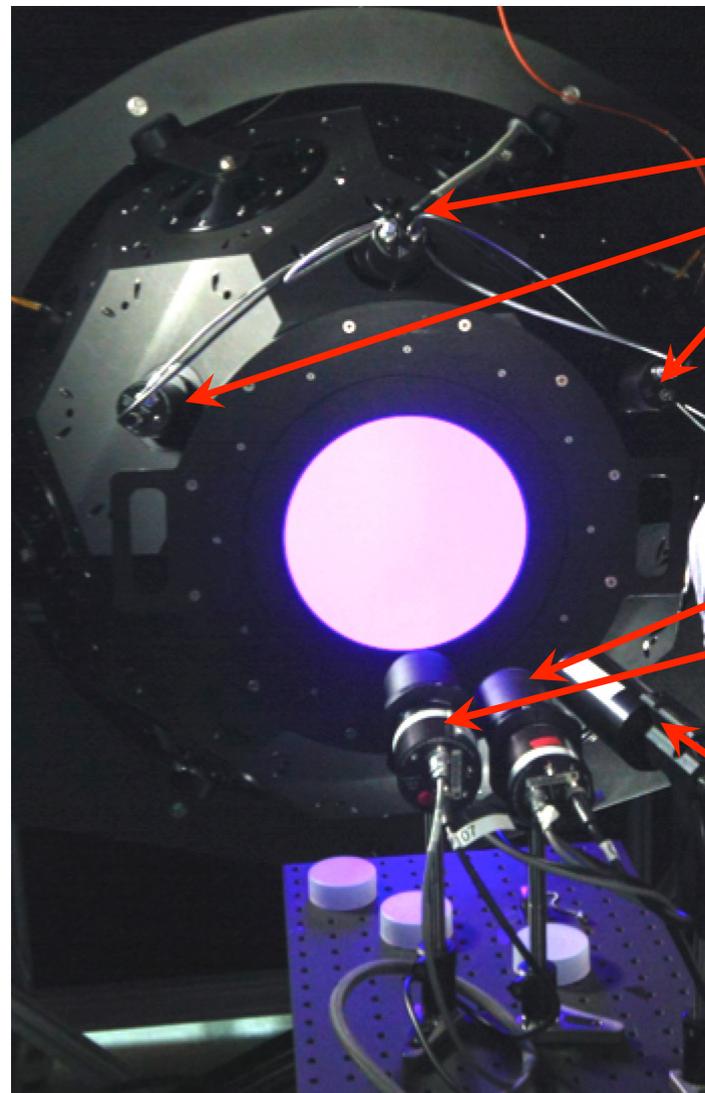

Traceability is transferred from a NIST transfer radiometer to the Sphere monitor during a laser sweep prior to VIIRS calibration.

Traceability is transferred from the Sphere to VIIRS during the spectral responsivity testing.

# Sphere calibration

## Sphere monitors

Silicon  
InGaAs  
Extended InGaAs

## Transfer radiometers

Silicon (LTD-11 #101)  
InGaAs (DET-8 IGA #109)  
ASD spectroradiometer

Sphere calibration transfers NIST traceability from transfer radiometers to sphere monitors that have fixed and permanent view of rear of sphere.

Sphere then placed in front of sensor to provide traceable, monochromatic extended source.

Concerns of this transfer include

- Sphere loading
- View geometry effects
- Uniformity

# Uncertainty from NIST radiometric characterization of transfer radiometers

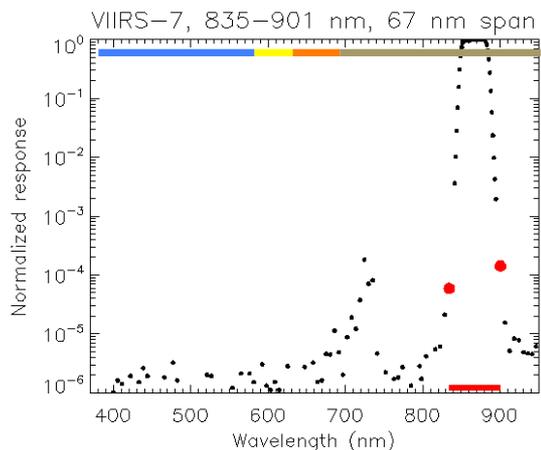

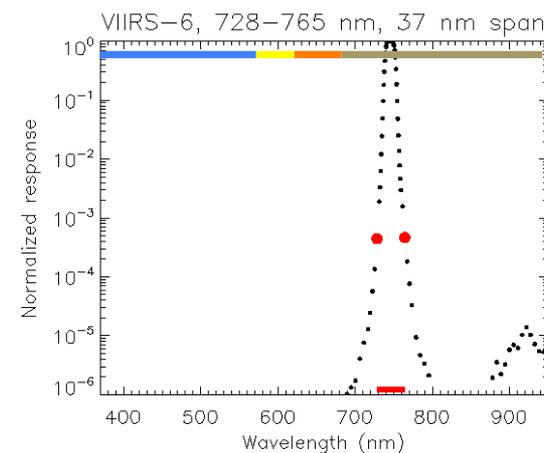

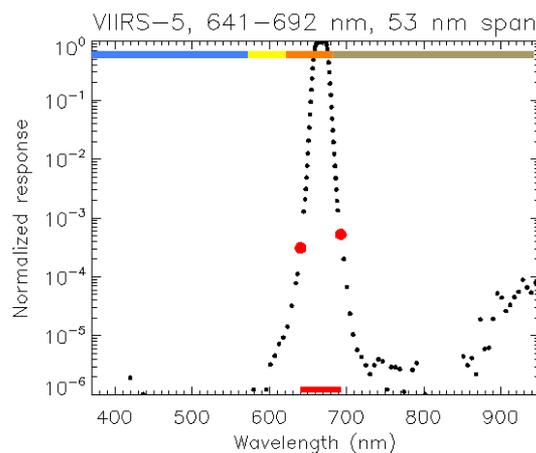

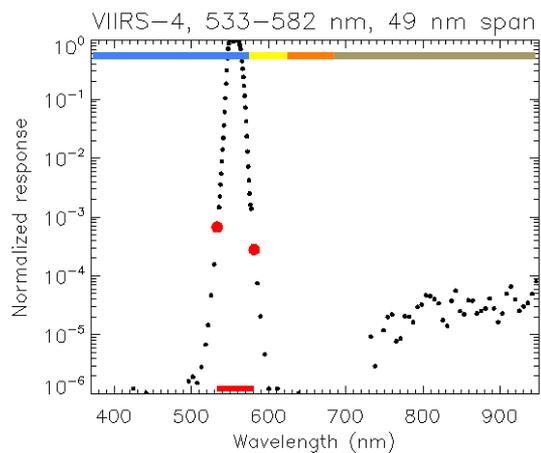

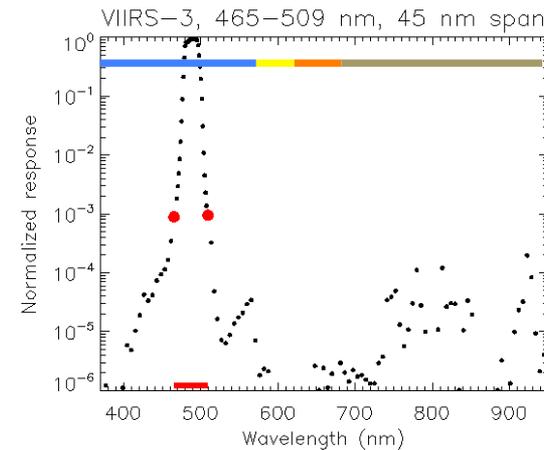

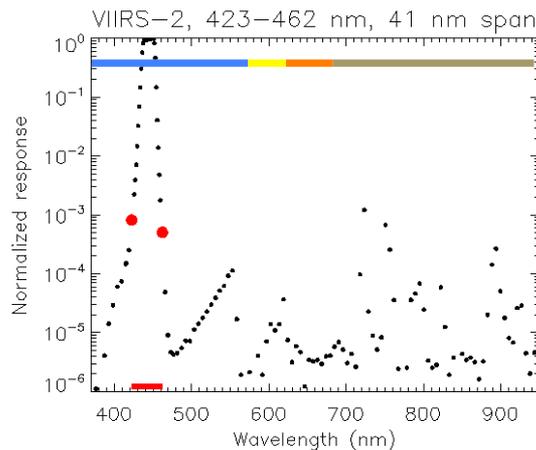

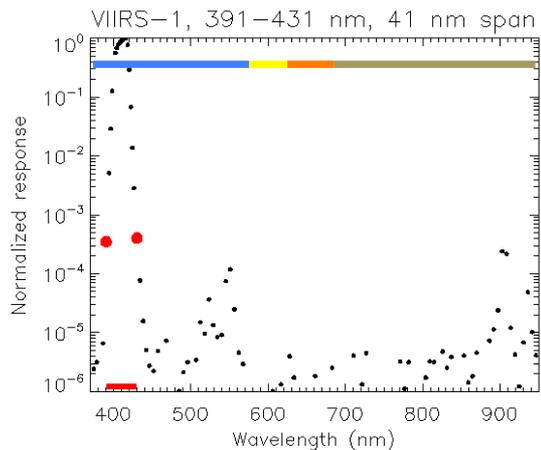

Uncertainty source (%)	300-400 nm	470-870 nm	895-991 nm	1001-1543 nm	1556-1643 nm
Source-radiometer distance	-	-	0.05	0.05	0.05
Geometry alignment	-	-	0.05	0.05	0.05
Amplifier gain	-	-	0.10	0.10	0.10
Reference irradiance cal aperture	-	-	0.50	0.30	0.50
Wavelength	-	-	0.01	0.01	0.01
E to L conversion	-	-	0.07	0.07	0.07
<b>Total (k=2)</b>	<b>0.55</b>	<b>0.11</b>	<b>1.04</b>	<b>0.66</b>	<b>1.04</b>

# JPSS-2 VIIRS example

- JPSS-2 VIIRS laser-based characterization will take place summer 2016
  - Vendor site in southern California
  - NASA lasers primary
  - NIST system provides redundancy
  - Traceability relies on transfer radiometers characterized by NIST

SS-2 scan of CLARREO team before PPBE meeting

First scan with SS-2

# FY17 Plans

- RS Instrument model development based on SS2
- Document laboratory calibration uncertainty below 1% (k=2) to 2.3 micrometers
- Absolute reflectance retrieval comparison to NIST standards to evaluate uncertainties
- Further measurements of solar and lunar irradiance in addition to field deployments
  - Repeatability of lunar retrievals
  - Absolute measurement of solar irradiance
- NIST-calibrated transfer radiometer data acquisition system completed to 2.3 micrometers
  - New SWIR laser on order (>4W 1.85-2.5 microns)
- Implementation of extended InGaAs transfer radiometers (characterization currently in progress at NIST with GSFC radiometers)
